

# Weekly Progress Report - 11

## **Section 1: Implementation/development progress**

During this week, I had placed my focus on preparing for our final presentation on June 11th. My assigned role for the presentation is to give a brief overview of our project including background, motivation, goals, and objectives. I will also be responsible for presenting our scope/research process. Lastly, I will be presenting our plans for future work during the next semester. At this stage, I have finished refining the scope section of the presentation by addressing the bias concerns mentioned by Yong Zhen during our last client meeting.

## **Section 2: Issues and Challenges**

No significant challenges were encountered this week, however, the schedule seems to be extremely tight and time is limited. A lot needs to be done in a short amount of time. Tasks need to be managed efficiently to ensure everything gets completed promptly and is of outstanding quality.

## **Section 3: Implementation Goals**

A professional and informative homepage and wiki section still need to be set up on our Git repository. I will work alongside Siqi to complete this task before our presentation. I will be looking back at my proposal as a reference to create a script for the introduction. I will be doing further research on the evaluation side of this project to present our further work. This semester we had focused on the replication of vulnerability detection methods. Next semester we will be evaluating those replicated models.
